

Research question: why does Napoli’s possession not become enough shot value?

Napoli can keep the ball and enter advanced zones, but possession often loses value at the final connection: longer passes are less secure, final-third actions are harder to complete, and many shots arrive from crowded or medium-quality positions.

- Report finding**
- Strong circulation and progression, especially through central midfield and the left half-space, but too few high-value final actions.
- Poster focus**
- We connect **pass length and completion**, **attacking benchmark percentiles**, **shot location and xG**, and **ball-loss danger**.
- Main message**
- Keep attacking ambition, but add cleaner support and better final-third timing so entries become cut-backs, lay-offs, and clearer shots.

1. Passing base: circulation is real, but longer passes add risk

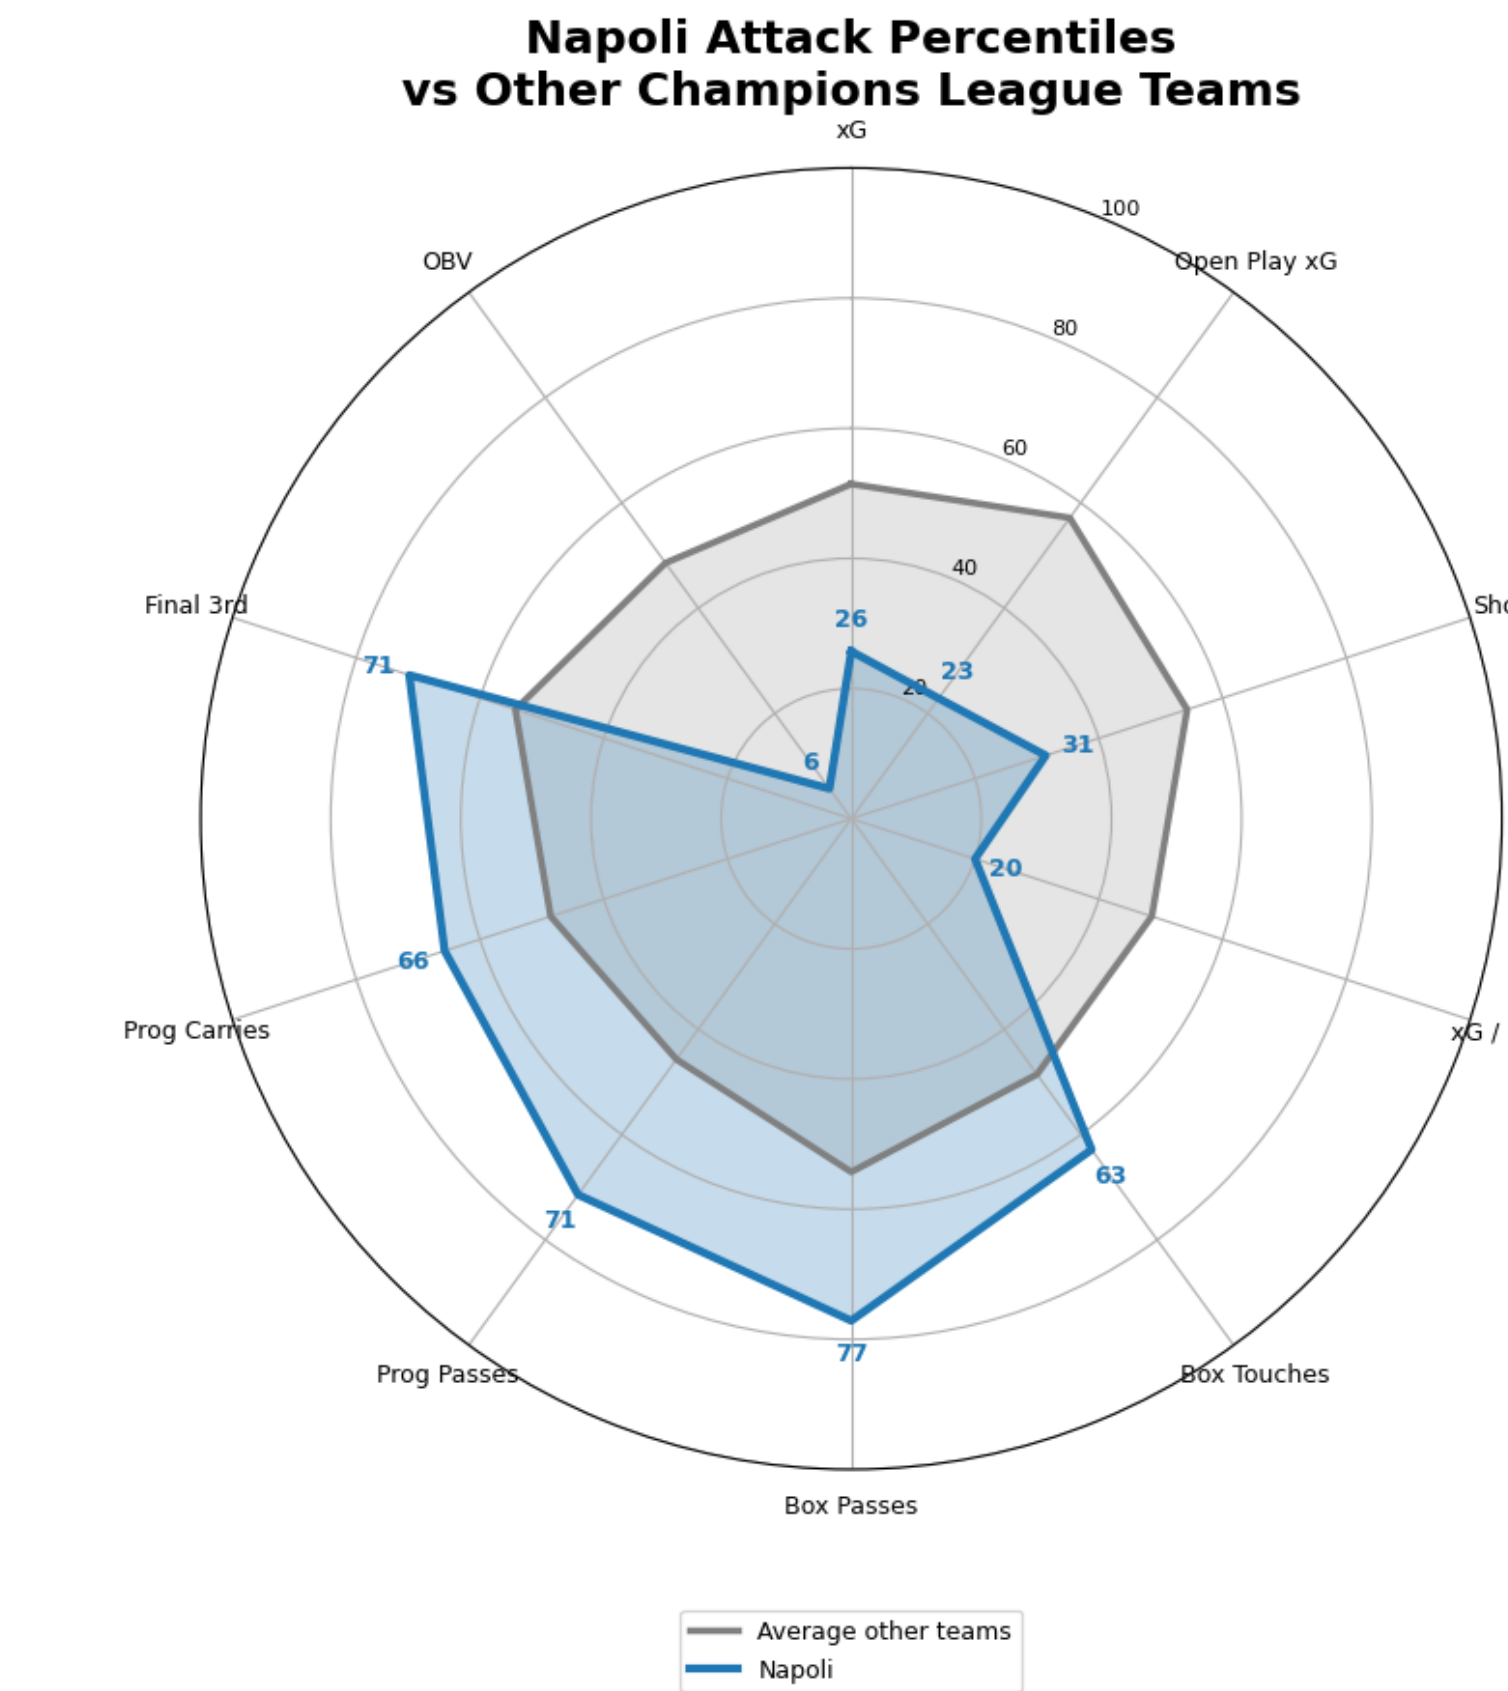

Napoli pass length and outcome. Short and medium passes form the main possession base; incompletions become more visible as distance increases.

Pattern	Interpretation
Most volume is short to medium range	Napoli can sustain controlled possession and circulate through midfield.
Longer passes have a weaker success profile	a Direct progression is useful, but it carries more turnover risk when support angles are missing.
Final-third passes need precision	The last pass must beat organized defenders, not only move the ball forward.

Napoli are not a team without structure. They build patiently and progress well, but risk rises when attacks depend on longer or forced passes, especially with many players already ahead of the ball.

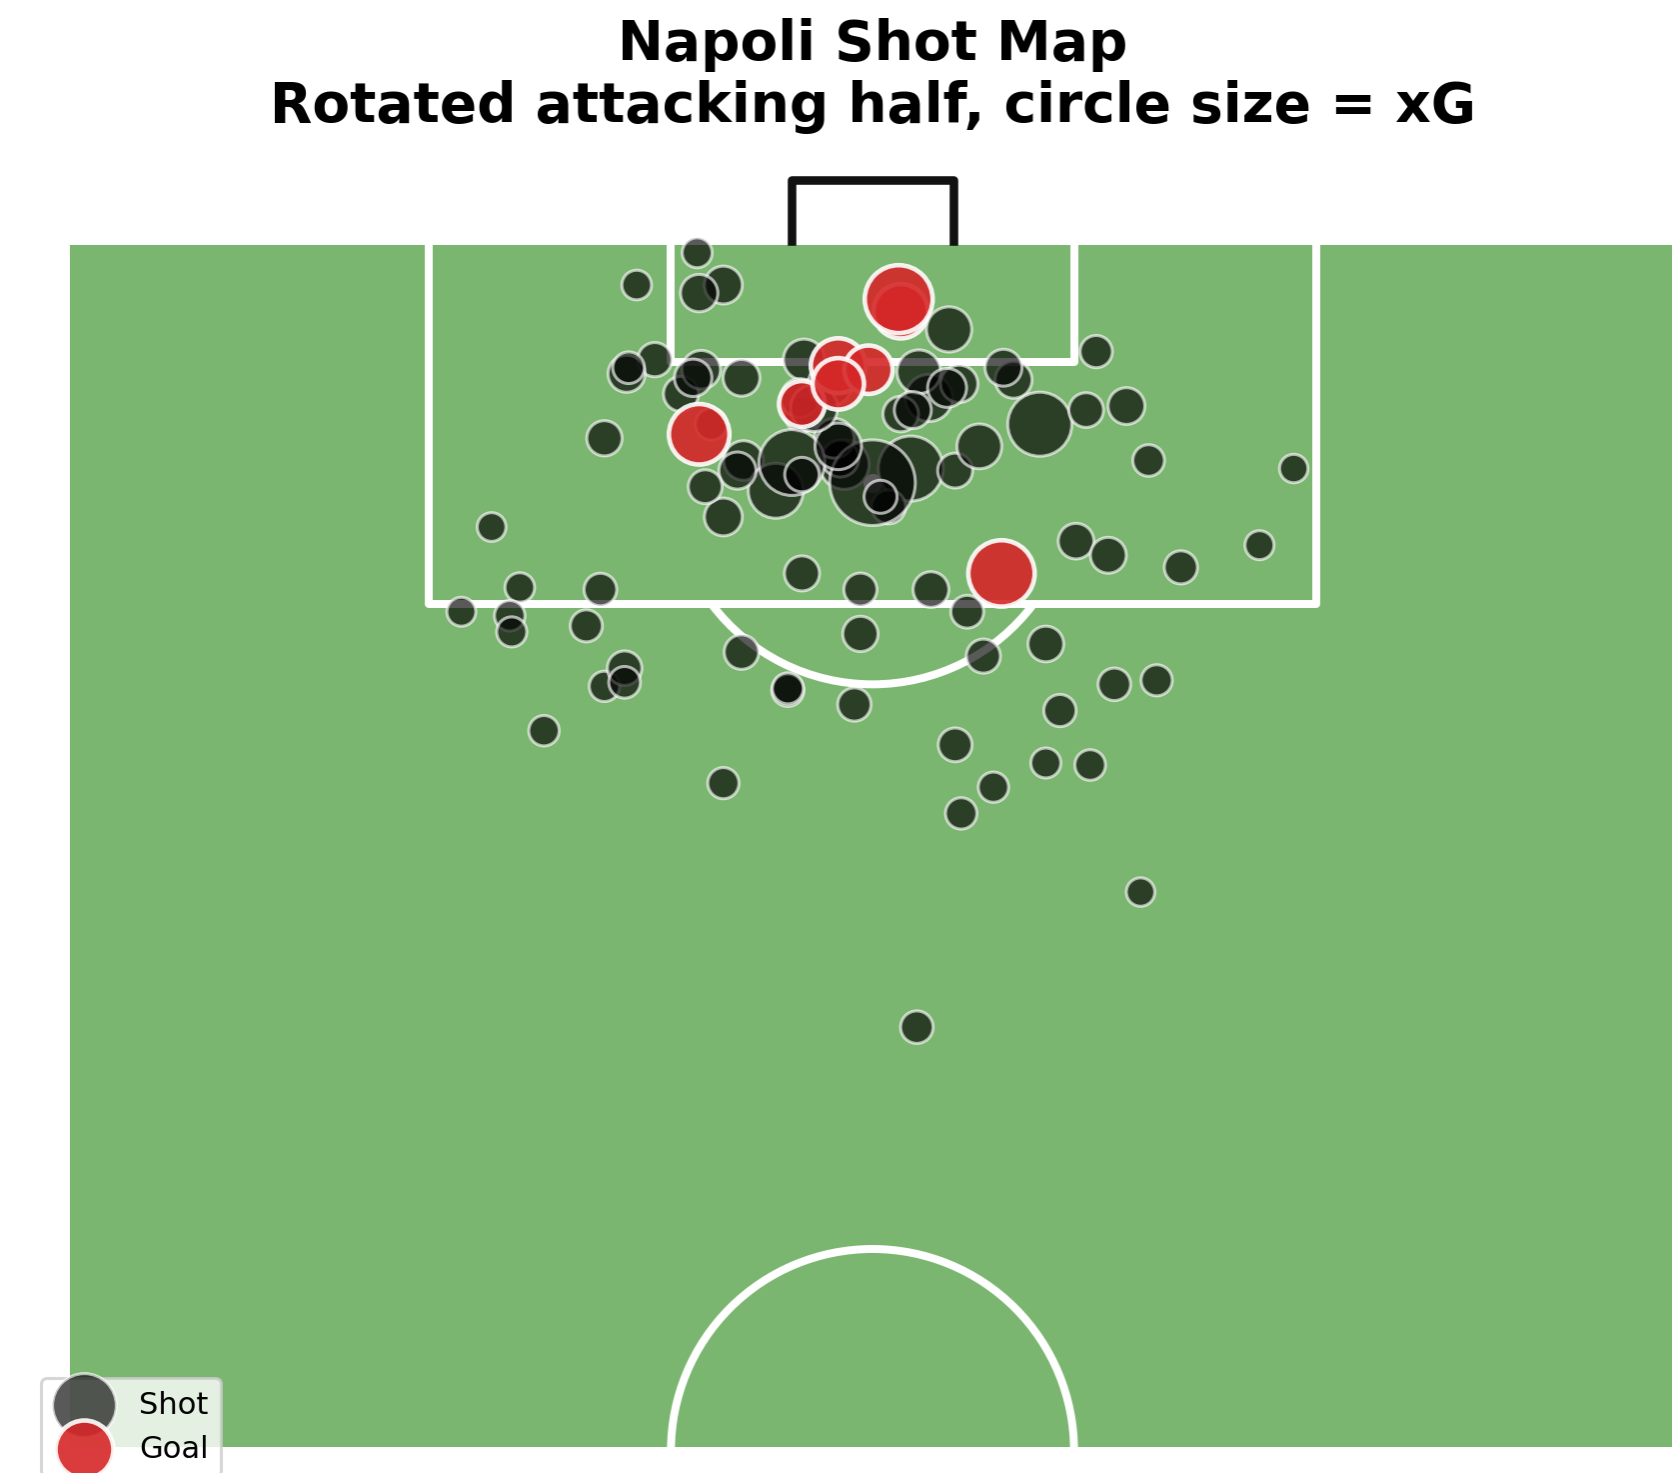

2. Attack radar: progression is stronger than end product

Attacking radar benchmark. Napoli’s progression and box-access profile is stronger than their shot-value output.

The radar summarizes the report’s main attacking mismatch. Napoli can progress, enter advanced zones, and access the box, but those entries do not translate into equally strong xG or on-ball value.

3. Shot map: Napoli arrive, but not cleanly enough

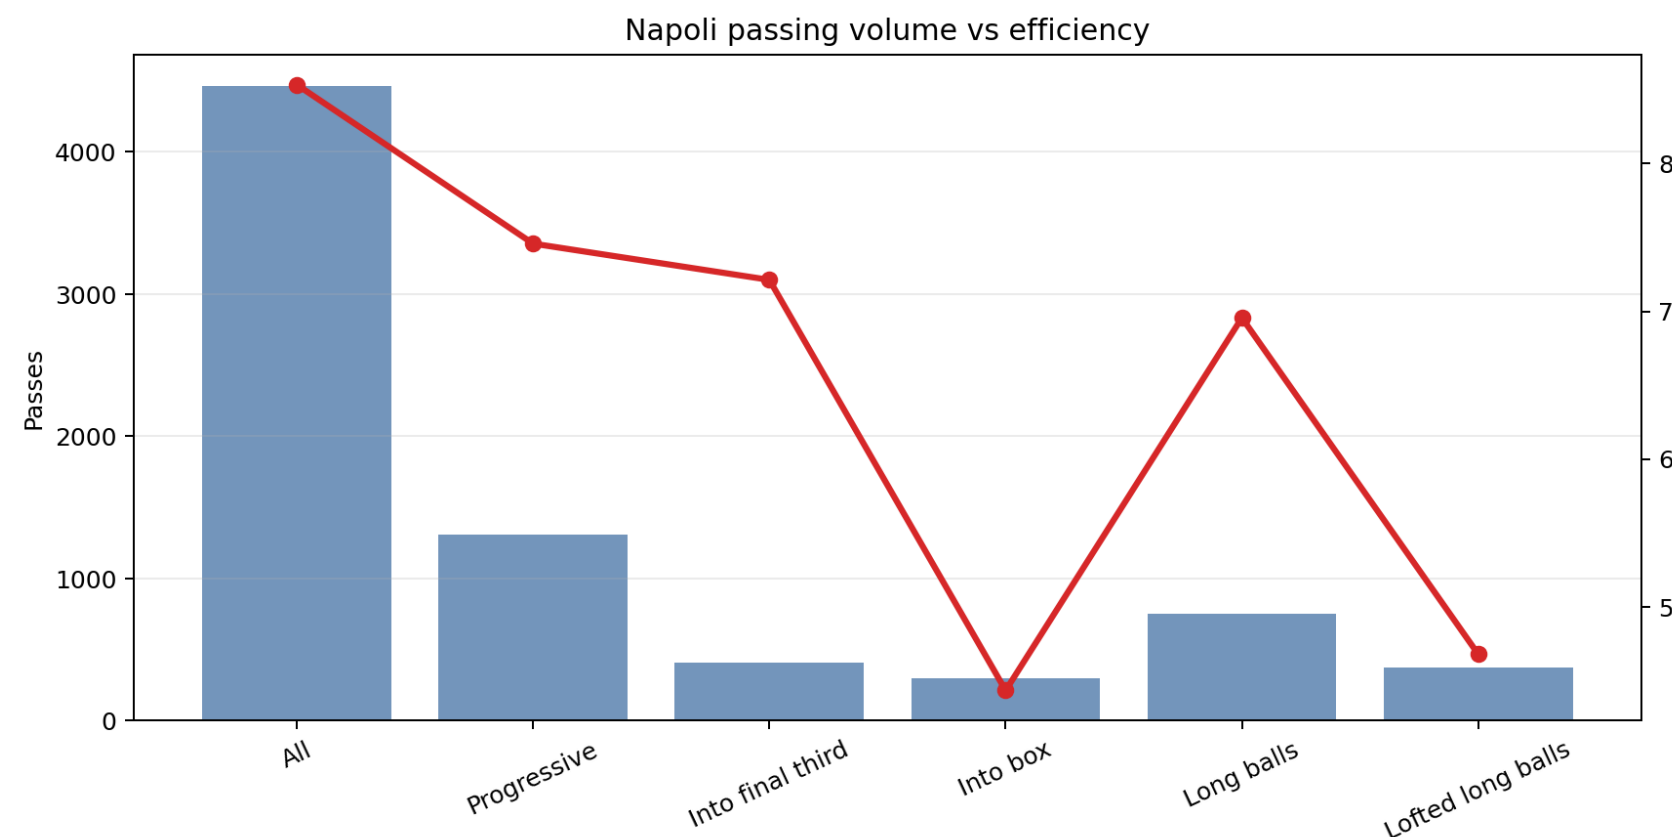

Poster shot map. Circle size represents xG; red shots are goals. The shot map reinforces the report’s main attacking conclusion. Napoli frequently reach the area in front of goal, so the issue is not a lack of access. However, many attempts are clustered around the penalty spot, the edge of the six-yard box, or just outside the most valuable central lane while defenders can still contest the shot. The larger red circles show that Napoli can create and finish good chances, but those moments are not frequent enough. Many smaller shots come after achieving territory, not after fully breaking the defensive structure.

4. What the shot locations imply

Observation	Football meaning
Central shot volume	Napoli do enter useful zones and are not relying only on hopeless wide shots.
Few very large xG shots	The final pass rarely creates tap-ins or completely open finishes.
Many medium-value attempts	The attack reaches pressure, but does not always move the defence one extra step.

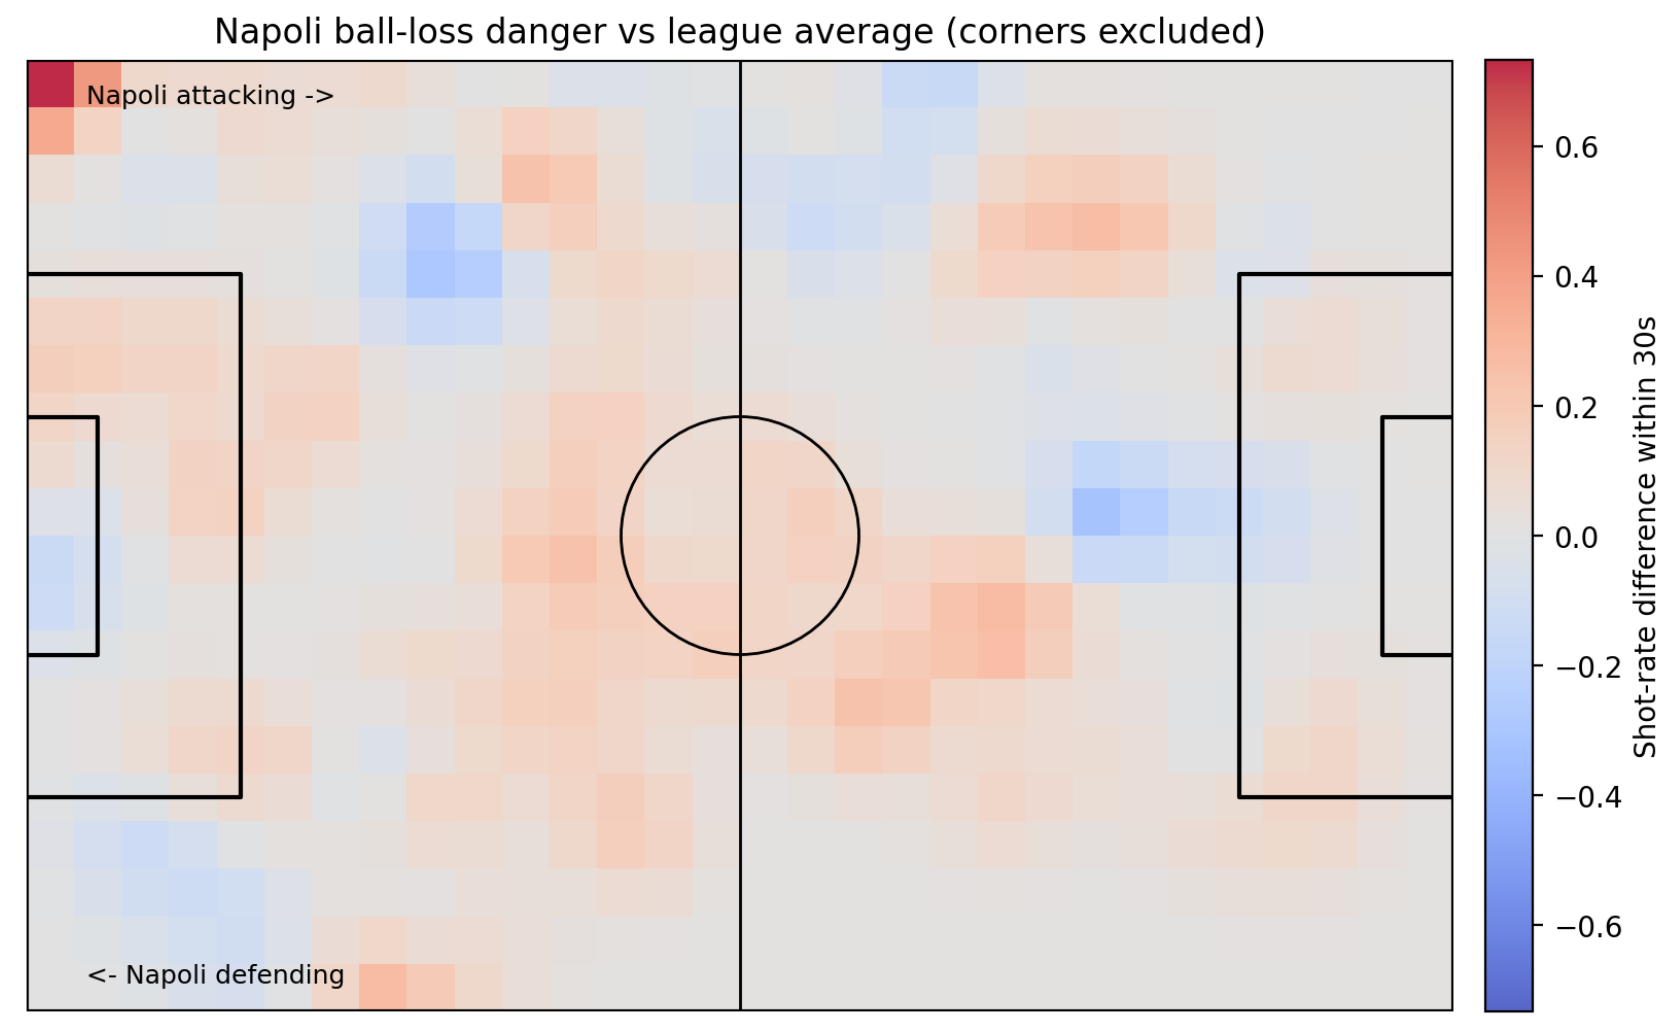

More shots alone will not solve the problem. Napoli need cleaner shots from the same access: third-player runs, delayed arrivals, and cut-backs after the back line is pulled toward goal.

6. Passing volume vs efficiency

High passing volume gives Napoli territory, but box entries and longer passes are less efficient than basic circulation.

5. Ball-loss danger: failed attacks are costly

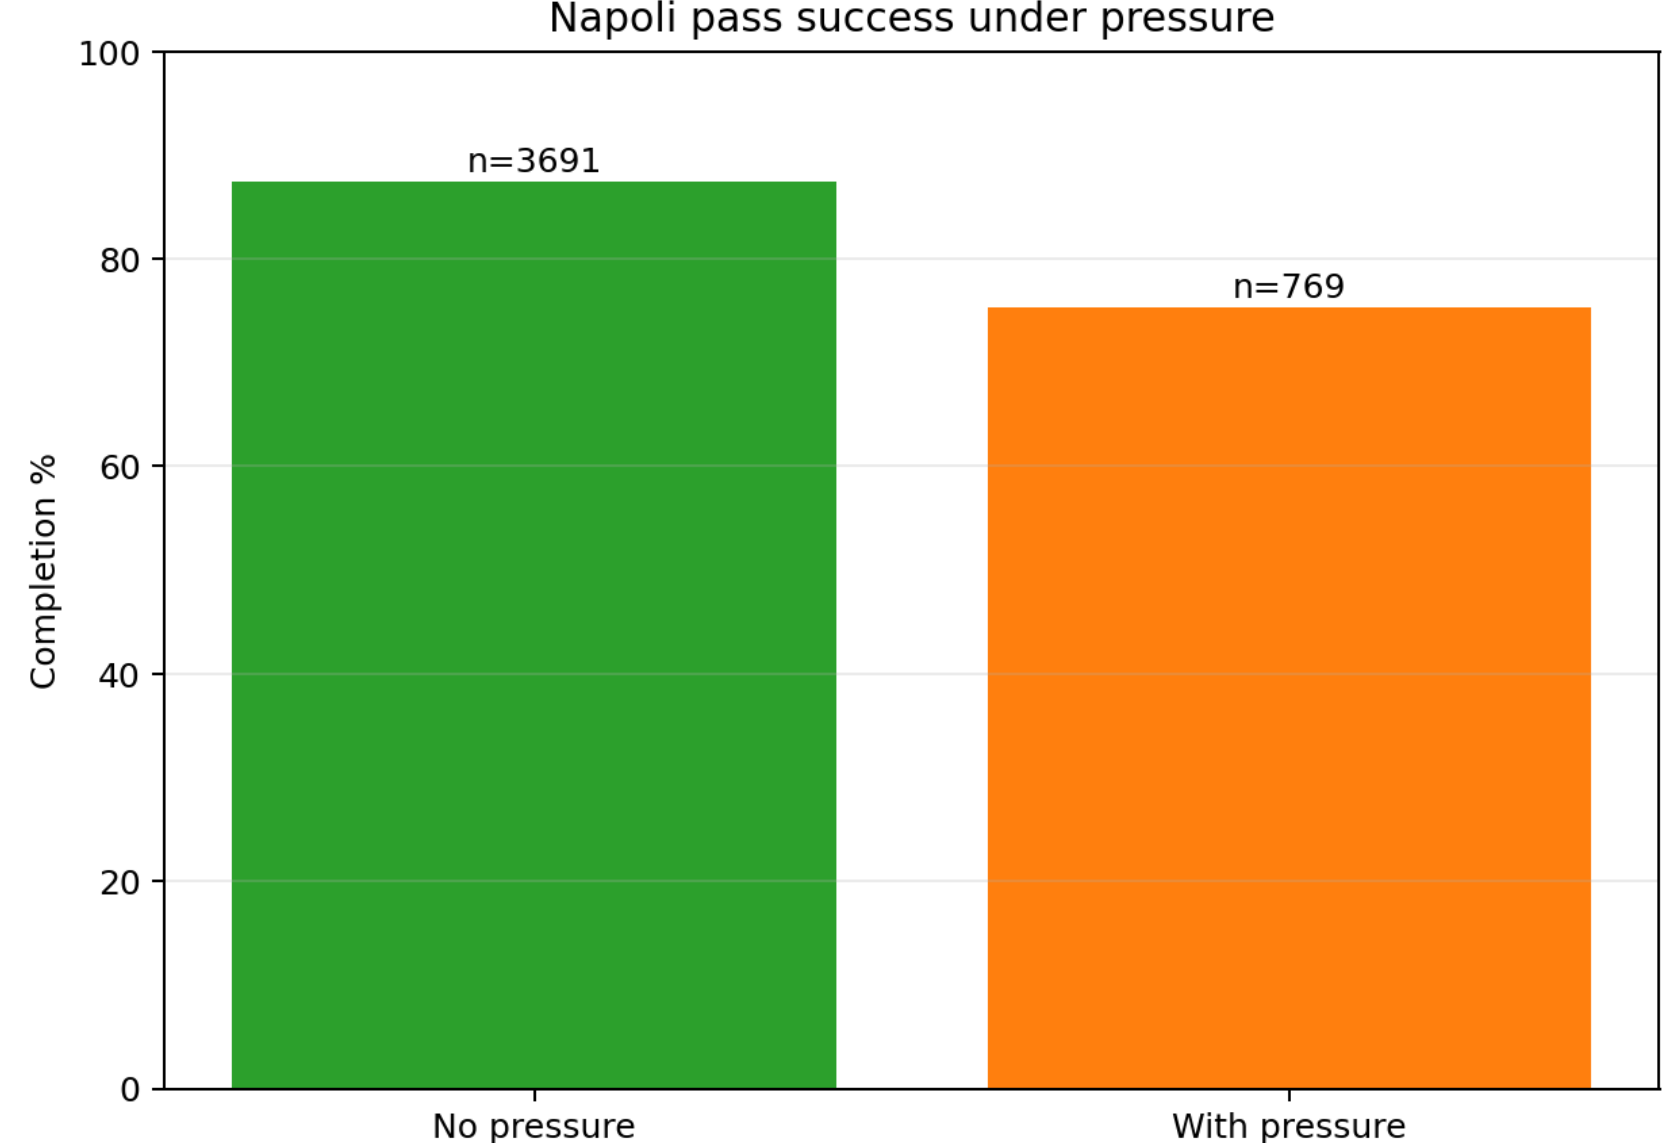

Ball-loss-to-shot danger against the same-match league average. Darker danger zones show where Napoli turnovers become shots more often than expected.

The heatmap adds the defensive cost of the attacking problem. When Napoli lose the ball in central midfield or on the left side after progressing, opponents can turn those turnovers into shots at an above-average rate. Napoli can keep attacking through these zones, but need better cover behind the ball before the risky pass or shot.

Recommendations

- Keep the possession base.** Short and medium passing gives control and field position.
- Improve the pass before the shot.** Use cut-backs, wall passes, and third-player runs.
- Use long passes with support.** Direct balls need nearby second-action coverage.
- Protect the loss zones.** Central and left-sided turnovers need closer midfield cover.

7. Pressure makes the last connection harder

Pass completion drops under pressure, which helps explain why final-third possession can break down before a clean shot appears.

Conclusion

Napoli’s issue is not access; it is converting access into chance quality. The passing and radar plots show stable progression, the shot map shows attacks ending before the defence is fully opened, and the loss-to-shot heatmap shows the transition cost. The fix is cleaner final actions with an elite striker.
